

TASK 4: Basic Chatbot

A simple rule-based chatbot in Python

Goal

Build a simple rule-based chatbot that replies to fixed user inputs.

Scope

User Input	Chatbot Reply
hello	Hi!
how are you	I'm fine, thanks!
bye	Goodbye!

Key Concepts Used

if-elif, functions, loops, input/output

Source Code

```
def get_reply(message):
    message = message.lower().strip()
    if message == "hello":
        return "Hi!"
    elif message == "how are you":
        return "I'm fine, thanks!"
    elif message == "bye":
        return "Goodbye!"
    else:
        return "Sorry, I don't understand that."

print("Chatbot: Say 'hello', 'how are you', or 'bye'.")
while True:
    user_input = input("You: ")
    reply = get_reply(user_input)
    print("Chatbot:", reply)
    if user_input.lower().strip() == "bye":
        break
```

How It Works

- **get_reply()** is a function that uses if-elif-else to match the input to a predefined reply.
- **.lower().strip()** makes matching case-insensitive and ignores extra spaces.
- The **while True** loop keeps the chat going until the user types "bye".

Sample Output

You: Hello

Chatbot: Hi!

You: how are you

Chatbot: I'm fine, thanks!

You: bye

Chatbot: Goodbye!
